Boost converter

Summary Overview History Applications Circuit analysis See also Further reading External links

Power for the boost converter can come from any suitable DC source, such as batteries, solar panels, rectifiers, and DC generators. A process that changes one DC voltage to a different DC voltage is called DC to DC conversion. A boost converter is a DC to DC converter with an output voltage greater than the source voltage. A boost converter is sometimes called a step-up converter since it "steps up" the source voltage. Since power (P) must be conserved, the output current is lower than the source current.

In this manuscript, interleaved boost-derived high gain DC-DC converters were reviewed and their salient aspects were presented. Interleaved boost converters are an interesting breed of
