Solar systems can be divided into

[Solar System Planets, Definition, Diagram, Names, Facts](#)

Our solar system is made up of our star, the Sun, and everything gravitationally connected to it, including the moons, asteroids, comets, and

Solar System Exploration

Our solar system includes the Sun, eight planets, five officially named dwarf planets, hundreds of moons, and thousands of asteroids and comets. Our

Solar system

Overview
Planets and their moons
Asteroids and comets
The interplanetary medium
The eight planets can be divided into two distinct categories on the basis of their densities (mass per u)
The relatively small inner planets have solid surfaces, lack ring systems, and have few or no moons. The atmospheres of Venus, Earth, and Mars are composed of a significant percentage of oxidized compounds such as carbon dioxide. Among the inner planets, only Earth has a strong magnetic field. The four giant outer planets are much more massive than the terrestrial planets and have immense atmospheres. Most of the known moons move around their respective planets in the same direction that the planets orbit the Sun. They are extremely diverse, representing a wide range of environments. Jupiter is orbited by Io, a body wracked by intense volcanism, while Saturn's largest moon, Titan—a body larger than Earth. See more on britannica
