

The future of photovoltaic energy storage model

The future of photovoltaic energy storage model

`std::future::get`

The `get` member function waits (by calling `wait` ()) until the shared state is ready, then retrieves the value stored in the shared state (if any). Right after calling this function, `valid` () is false.

Firstly, an introduction to the structure of the photovoltaic-energy storage system and the associated tariff system will be provided.

`std::future::future`

2) Move constructor. Constructs a `std::future` with the shared state of other using move semantics. After construction, `other.valid() == false`.

`std::future::wait_until`

`wait_until` waits for a result to become available. It blocks until specified `timeout_time` has been reached or the result becomes available, whichever comes first. The return value indicates why

std::shared_future

Unlike std::future, which is only moveable (so only one instance can refer to any particular asynchronous result), std::shared_future is copyable and multiple shared future objects

std::future

The class template `std::future` provides a mechanism to access the result of asynchronous operations: An asynchronous operation (created via `std::async`, `std::packaged_task`,

std::future::wait_for

If the future is the result of a call to `std::async` that used lazy evaluation, this function returns immediately without waiting. This function may block for longer than `timeout_duration` due to

Long-Duration Storage Needs Federal Support
Reward Consumers For More Flexible Electricity Use
Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible. std::future::valid

Checks if the future refers to a shared state. This is the case only for futures that were not default-constructed or moved from (i.e. returned by `std::promise::get_future()`),
